

Metro Ticket Generating System

REQUIREMENT ANALYSIS PHASE

Date	25 July 2026
Name	T V SAI LAXMI
Project Name	Metro-Ticket-Generating-System
Maximum Marks	

4. Customer Journey Map

4.1 Purpose

The customer journey map traces the end-to-end experience of a commuter, from realising the need to travel through to completing the trip and reflecting on the experience afterwards. It highlights the actions, touchpoints, emotions, and pain points at every stage of the existing manual process, and identifies where a ServiceNow-based digital solution can remove friction and improve satisfaction.

4.2 Persona Reference

Persona: Ravi Kumar, 27, Private company employee, travelling daily by metro to reach office on time without wasting time at the ticket counter (as defined in the Empathy Map, Phase 1.2).

4.3 Journey Map Visual

Customer Journey: Metro Ticket Booking

Figure 4.1: Six-stage commuter journey with associated emotional curve

4.4 Stage-wise Journey Breakdown

Stage	Commuter Actions	Touchpoints	Emotion	Pain Points
Awareness	Realises the need to travel; recalls past queue delays	Memory of previous visits, word of mouth	Neutral / Slightly anxious	Uncertainty about queue length and fare

Stage	Commuter Actions	Touchpoints	Emotion	Pain Points
Trip Planning	Checks route, timing, and approximate fare mentally	Fare charts, station signage, asking others	Curious	No easy way to check fare/route in advance
Ticket Booking	Queues at counter or token vending machine	Ticket counter, vending machine	Hopeful, then impatient	Long queues, machine downtime, manual entry errors
Payment	Pays via cash or card, waits for change/receipt	Counter staff, card machine	Cautious	Exact change issues, card machine failures
Ticket Receipt	Collects physical token or paper ticket	Physical token/ticket	Relieved	Risk of losing or damaging the token
Travel & Entry/Exit	Scans/inserts token at gate, boards train, exits at destination	Station gates, platform	Satisfied (if on time)	Gate jams, re-verification delays on exit

4.5 Key Moments of Truth

- The **Ticket Booking** stage is the single biggest point of friction, driving the most negative emotion in the journey.
- The **Ticket Receipt** stage carries hidden risk (lost/damaged tokens) that only surfaces later at the exit gate.
- A smooth **Trip Planning** experience (visible fare and route upfront) has an outsized positive effect on the rest of the journey.
- Digitising booking and payment collapses three friction-heavy stages (Booking, Payment, Ticket Receipt) into a single self-service action.

4.6 Opportunities for the Digital Solution

Journey Stage	Opportunity
Trip Planning	Show live, automatically calculated fare and route before the commuter leaves home
Ticket Booking	Replace the counter/vending queue with a ServiceNow Service Catalog booking form
Payment	Enable instant digital payment, removing cash/change dependency
Ticket Receipt	Issue an instant QR-code digital ticket, eliminating token loss/damage risk
Travel & Entry/Exit	Allow direct QR scan at gates for a faster, contactless entry/exit experience

4.7 Insight Summary

Mapping the journey confirms that commuter dissatisfaction is concentrated around three consecutive manual stages: booking, payment, and ticket receipt. Replacing these with a single self-service digital flow — Service Catalog booking, automated calculation, and instant QR-code ticket delivery — directly targets the lowest points on the emotional curve and is expected to raise overall journey satisfaction end to end.
